Optical sealing film is a transparent, adhesive film used to cover microplates in laboratory experiments, especially PCR (Polymerase Chain Reaction) tests. It seals the plates to prevent contamination, evaporation, and leakage. Its optical clarity allows for accurate reading and analysis of results, particularly in fluorescence or luminescence-based assays.

- Allows for real-time monitoring of reactions without compromising well integrity.
- Protects samples from evaporation and contamination throughout the PCR process.
- Maintains seal integrity across a wide range of temperatures commonly used in PCR.
- Compatible with automated liquid handling systems for easy sample addition and removal.
- Protects the integrity of your precious nucleic acid samples.
